4. Target Audience 2

1. Concept

TUSMindSpace is a proposed Android mobile application designed to help TUS students manage everyday academic stress and improve their mental wellbeing. Students often experience stress due to assignments, exams and other academic responsibilities. The aim of this app is to provide a simple platform where students can record their moods, express their thoughts through journaling, practise step by step guided meditation and access wellbeing support services. The app will encourage students to develop positive daily habits and become more aware of their emotional wellbeing.

2. Features

Mood Tracker: Students can record their daily mood by selecting options such as Happy, Okay, Sad or Stressed and view their previous mood records.

Personal Journal: Students can write about their daily experiences, thoughts and feelings and review previous entries.

Guided Meditation: Students can choose short breathing or relaxation exercises. The app will provide step-by-step instructions and a timer to guide them through each session.

Daily Notifications: Students will receive reminders encouraging them to take breaks, practise mindfulness or record their mood.

Wellbeing Resources: Google Maps will display nearby mental health and wellbeing support services.

Contact Us: Students can view support contact information and use the phone dialler to contact a relevant service.

Data Storage: Room will store user records locally, while Firebase will provide cloud storage and synchronisation across devices.

3. User Journey

When a student opens TUSMindSpace, they will see a home screen containing the main features. They can start by selecting their current mood and writing a journal entry about their day. If they feel stressed, they can choose a guided meditation exercise and follow the breathing instructions displayed on the screen. After completing the exercise, they can record how they feel again. Students can also view their previous mood records, meditation history, receive daily reminders and use the resources section to find nearby wellbeing support services.

4. Target Audience

The main target audience is TUS students who experience academic stress or want to improve their daily wellbeing. The app will be particularly useful for students managing assignments, exams and other academic responsibilities. It will have a simple and student-friendly interface designed for both phones and tablets.

Proposed Development Approach

The application will be developed using Kotlin and Jetpack Compose in Android Studio, with Jetpack Compose Navigation for moving between screens. GitHub will be used for version control, and development will follow an Agile sprint-based approach.
